The reason of tempered glass self explosion

The self explosion rate of architectural glass is about 3‰, reasons as below:

1. The Nis inside the glass.
2. Stones or other impurity inside the glass.
3. The uneven compression inside the tempered glass.
4. Over tempered, high compression.
5. Scratches, chips before tempering.

To help prevent the self explosion of architectural tempered glass, please consider heat soak test for your tempered glass especially when glass is installed in high rise projects or the applications where it’s difficult to replace. After heat soaking, the spontaneous breakage ratio can be decreased much.

Click here to learn more about heat soak test.
